

Recreating harmonious bodies for a new vision of rebirth

Laboratoires SEBBIN offers high quality implants for aesthetic and reconstructive surgery

Beauty becomes more and more important in our society. Modern plastic surgery makes it possible for women and men to conform to their ideal of a perfect body. Whether for reconstructive or aesthetic purposes – a broad range of silicone implants, for instance breast, calf or gluteus implants, gives us the possibility to reconstruct ourselves not only from an aesthetic but also from a psychological point of view. The French company Laboratoires SEBBIN headquartered in Boissy l' Aillerie develops, manufactures and markets high quality implants and expanders for cosmetic and reconstructive surgery.

For more than 25 years now, SEBBIN has been creating innovative silicone implants that fulfil highest demands in terms of quality and safety. “All our implants are hand-crafted,” emphasises CEO Diederik Van Goor SEBBIN’s added value. “This way, we can guarantee optimum safety of our products. Moreover, we only use raw materials authorised by the highest American authorities of the Food & Drugs Administration. Our certifications according to ISO 9001 and 13485 standards ensure the compliance with European Directive 93/42.” The mainstay of the company’s business are breast implants with a share of 75% of the overall business volume. SEBBIN provides a broad portfolio of inflatable, cohesive round, high cohesive round, short anatomical or tall anatomical implants in many different sizes and

of variable firmness. “We always strive to meet the requirements of women,” states President Olivier Perusseau. In addition to breast implants, the company offers testicular implants, gluteus implants, calf implants as well as a wide range of tissue expanders in different shapes and sizes to suit all types of tissue augmentation surgery. Possible shapes are, for instance, crescent, rectangular, round, cylindrical, anatomical, facial or kidney shape. A special offer of Laboratoires SEBBIN is the custom-made implant. “These implants are used to compensate a bone deficiency or malformation,” explains Mr. Van Goor. “We have a wide range of implantable silicone from semi-solid silicone to the silicone elastomer shell pre-filled with a cohesive silicone gel with variable firmness.”

A speciality of SEBBIN are custom-made implants

The implants are manufactured from an imprint or scanned image. The company uses a plastic surgery and computer assisted 3D design, which makes it possible to develop high precision custom-made parts for areas that are difficult to access. With its innovative and high quality implants Laboratoires SEBBIN has become renowned in the area of plastic surgery. Today, the company is among the leading producers in the market worldwide employing a workforce

All SEBBIN implants fulfil highest demands in terms of quality and safety

of 80 people and generating annual revenues of about ten million EUR. Surgeons and their patients around the world rely on implants and expanders made by SEBBIN. The company supplies its products to 50 countries and realises 85% of its revenues through the export business with South America being the most important market followed by Central Europe and Asia. “The market for silicone implants is comparatively young and offers a lot of potential,” says the CEO. “We want to strengthen our position in the industry entering new markets and developing new and more innovative products. We work closely together with surgeons for reconstructive and aesthetic surgery to find out about the requirements of the patients.”

One of the plans SEBBIN has for the future is to offer complementary

products for silicone implants, for instance special bras for patients after the surgery. Social aspects are important for SEBBIN, as well, and the company provides free implants for an organisation, which treats fire victims in Vietnam. “Whether for cosmetic or reconstructive purposes,” points out Mr. Perusseau. “Our high quality implants are a safe solution recreating harmonious bodies for a new vision of rebirth.” ■
